### DETAILED ACTION

1. Claims 21-25 and 34 have been amended.
2. Claims 26-28 has been cancelled.
3. Claims 1-25 and 29-34 are pending.

### *Response to Arguments*

1. Applicant's arguments filed 28 October 2008 have been fully considered and they are persuasive.

### *Allowable Subject Matter*

2. Claims **1-25 and 29-34** are allowed.
3. The following is an examiner's statement of reasons for allowance: The present invention is directed towards a method and apparatus for processing descriptive statements. Claims 1, 12, 16, and 21 identifies the uniquely distinct features **"using a digital processor to independently compute a hash value for each of the multiple statements and applying a commutative function to each hash value, to obtain an aggregate hash value representing all of the multiple statements"**. Claims 29 and 33 identifies the uniquely distinct features **"using a digital signature to independently compute an aggregate hash value for each of the multiple descriptive statements and applying a commutative function for each hash value, to obtain an aggregate hash value representing all of the descriptive statements"**.

The closest prior art, Moore (Pub No. 2006/0265489) discloses building a graph of the connections among a group of networked routers and then assigning a value to

Art Unit: 2437

each such link indicative of its desirability for use to convey data between two such routers.

However, either singularly or in combination, Moore fail to anticipate or render obvious the claimed limitations of using a digital processor and/or digital signature to independently compute a hash value for each of the multiple statements and applying a commutative function to each hash value, to obtain an aggregate hash value representing all of the multiple statements.

The closest prior art, Massarenti (Pub No. 2004/0244012) discloses one or more electronically-accessible media including electronically-executable instructions that direct an apparatus to perform actions including: inserting a type signature tag into a serialized binary blob to serialize an object, the type signature tag including a type signature based on an object type of the object; and transmitting the serialized binary blob. An arrangement including: a signature table having multiple entries, each respective entry of the multiple entries associating a respective object type with a respective type signature, each respective type signature created responsive to a structural representation of the respective object type associated therewith. An apparatus including: one or more media having electronically-executable instructions; and one or more processors capable of executing the electronically-executable instructions to perform actions including: receiving a serialized binary blob; and deserializing an object by extracting a type signature from the serialized binary blob, the type signature derivable from an object type of the object.

However, either singularly or in combination, Massarenti fail to anticipate or render obvious the claimed limitations of using a digital processor and/or digital signature to independently compute a hash value for each of the multiple statements and applying a commutative function to each hash value, to obtain an aggregate hash value representing all of the multiple statements.

5. Therefore, **claims 1, 12, 16, 21, 29, and 33** and the respective **dependent claims 2-11, 13-15, 22-25, 30-32, and 34** are in condition for allowance.

### ***Conclusion***

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
